To Whom It May Concern,

I am writing to recommend Jeremiah Jenkins for this position.

I mentored Jeremiah during the Summer 2026 internship session in the Intelligent Systems Division at NASA Ames Research Center. During this time, he worked on the HADES (Hazard Analysis DESigner) software in a team of five interns, where his contributions were instrumental in the core development of the software.

In this internship, he (1) helped the team understand how the legacy codebase worked and identified a number of vulnerabilities to address, (2) improved and integrated a database into the software so that hazard information could be functionally stored and retrieved, (3) refactored the legacy code to have a more maintainable structure and enable individual features developed by a larger software team to be readily integrated, and (4) created the main interface that enables the user to generate hazard tables from a system architecture diagram.

As his mentor, I was able to see him identify and take on a wide range of challenges and come to a solution that moved the ball forward for our project. His software engineering expertise was key in putting this software project on the right track as it matured from buggy “research code” to a usable product. In addition to software engineering talent, he also showcased some important skills that will serve him well in the future, including critical thinking, effective communication, and teamwork. I very much appreciate the thought and active problem-solving he brought to every discussion.

With all this in mind, I want to state my recommendation for this role as he takes this next step.

Sincerely,

Daniel Hulse, Ph.D
Research Software Engineer
