Github | Jeremiah Jenkins

Computer Science student with hands on experience across AI, security, and system modernization. Proven ability to strengthen codebases, build scalable tools, and deliver practical, high impact engineering solutions.

Education

Bachelor of Engineering – Computer Science
North Carolina Agricultural & Technical State University | GPA: 3.03
Greensboro, North Carolina | Expected Graduation: 12.2026

Work experience

Software Engineering Intern | NASA *Mountain View, California|05.2026-08.2026*

- Modernized HADES core systems using Node.js, TypeScript, Electron, and PouchDB.
- Rebuilt PouchDB architecture for reliable real-time hazard modeling.
- Resolved 42 security vulnerabilities across dependencies and internal modules.
- Refactored major subsystems and stabilized Electron installation flows.
- Integrated LocatorJS and improved project architecture for future scalability.

.Net Developer Intern | AgFirst Farm Credit Bank *Columbia, South Carolina |05.2025-08.2025*

- Led archive project for bank and association reports, reducing storage usage by 30%.
- Helped with the Go Live of a DNA Systems Upgrade, which upgraded the bank's security and loaning systems.
- Granted bank overseas partners access to the DNA servers and features.
- Tested AI and Machine Learning Models for the bank.

Web Developer Intern | AgFirst Farm Credit Bank *Columbia, South Carolina |05.2024-08.2024*

- Enhanced the functionality of 3 bank user apps using OutSystems, improving user experience by 25%.
- Logged over 500 editor changes, maintaining 95% accuracy in task management.

Skills

Languages: Python (primary), Java, C++, SQL, Powershell, TypeScript
Frameworks/Libraries: scikit-learn, Pandas, Git, Express.js, Node.js, Streamlit, Scipy, PyTorch, REST APIs, Vite
Tools/Platforms: Azure, GitHub, React, Postman, OutSystems, Excel, UC4, DNA,Qiskit, Electron

Projects | Certificates |Achievements

NASA Quantum Orbiter — Quantum-Enhanced Orbit Determination
Created a classical-vs-quantum orbit determination MVP using Python, NumPy, and Qiskit. Simulated orbital measurements, built a classical solver, and implemented a quantum circuit to encode orbit decisions using Aer simulation, mirroring the hybrid analytical workflows used in modern NASA orbit-tracking systems.

WealthWhiz (Hackathon Winner, Capital One Summit 2025)
Developed a web app to simplify budgeting and financial planning. Implemented dynamic budget calculators and REST API integrations, along with Machine Learning and ChatGPT integration.

Just a Rather Very Intelligent System (J.A.R.V.I.S)
Built a voice-activated assistant using Machine Learning, Python, SpeechRecognition, and Pyttsx3 for real-time speech processing and personalized responses.
